

AIR POLLUTION

Factories make items we use, but also contribute to air pollution. We can reduce impact by using less stuff.

When we power our buildings with oil and natural gas electricity sources, it pollutes the air. You can reduce by turning off lights when not being used and unplugging items when not in use!

Airplanes burn a lot of fossil fuels, which makes the air less clean.

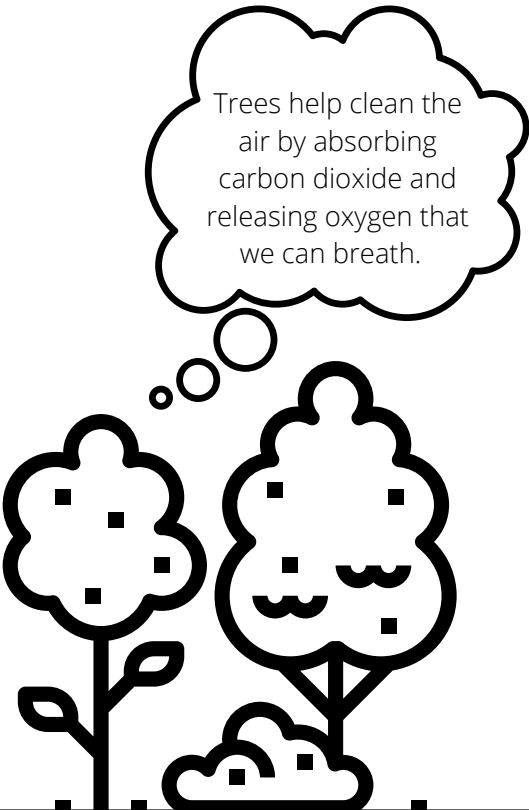

"Deforestation" is a term that means when trees are cut down in large amounts. Trees help clean our air, so we want to save them and plant more!

When big trucks move stuff around, it emits a lot of gas fumes. You can shop locally or reduce purchases!

Cars that burn gasoline make our air dirty. You can bike or walk more or take the bus instead.

AIR POLLUTION

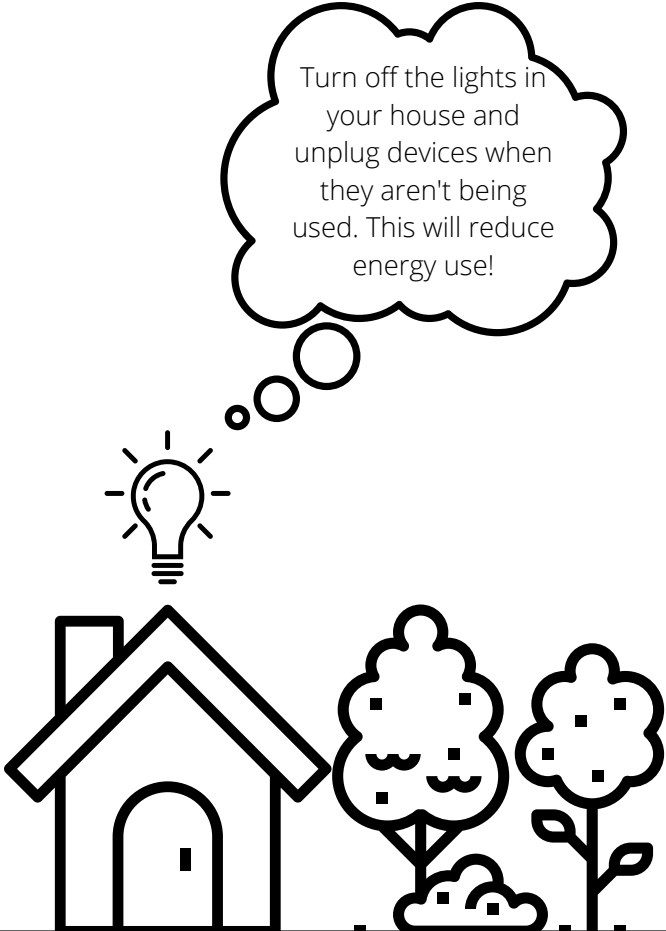

How can we help keep our air clean?

Trees help clean the air by absorbing carbon dioxide and releasing oxygen that we can breathe.

Biking and walking places instead of taking a car helps reduce air pollution.

Turn off the lights in your house and unplug devices when they aren't being used. This will reduce energy use!
